INTRODUCTION:

In this project we have used HTML and CSS to design website for Income Tax Department. In this website there are many things like login, FAQ's, about us ,etc. we can see them below:

HOME PAGE:

As mentioned above there are many things in home pages like login, news and updates, quick links, FAQ's, about us, contact us, accessibility.

In login users can login their account by using their username and password. If they don't remember their password there is a option as forgot password. If user click on forgot password another webpage will open and there user will be asked their username and OTP that has sent to registered phone number or email and the user can create new password and confirm that new password and if user done that again that will redirect to login page.

In signup people can create new account.

In news and updates people can see latest news and updates about income tax department.

In quick links there are links like quick pan, Tax Calendar, return filing, link aadhar. People can click the links and link their accounts in Income tax department

In about us people can understand about the income tax department.

In contact us people can contact through the contacts provided in website.

In feedback people can give their feedbacks.

In accessibility people can access can the data by user name and password.

CONCLUSION:

By doing this project we have learnt about HTML and CSS.

Our reference for this web-page is incometax.gov.in .
